

Graph Connectivity Trees

Connected Components

Every graph consists of separate connected pieces (subgraphs) called **connected components**

Connected Components

3 connected components

the more connected components,
the more "broken up" the graph is.

Connected Components

The connected component of vertex $v ::=$

$$\{w \mid v \text{ and } w \text{ are connected}\}$$

Connected Components

So a graph is **connected** iff it has only
1 connected component

Edge Connectedness

Def: vertices v, w are **k -edge connected** if they remain connected whenever fewer than k edges are deleted.

k-edge Connectedness

no path

1-edge connected

Albert R Meyer, March 12, 2010 lec 6F.8

Edge Connectedness

no path

2-edge connected

Albert R Meyer, March 12, 2010 lec 6F.9

Edge Connectedness

no path

3-edge connected

Albert R Meyer, March 12, 2010 lec 6F.10

k-edge Connectedness

Def: A whole graph is **k-edge connected** iff every two vertices are **k-edge connected**.

Albert R Meyer, March 12, 2010 lec 6F.11

Edge Connectedness

Connectivity measures **fault tolerance** of a network: how many connections can fail without cutting off communication?

Albert R Meyer, March 12, 2010 lec 6F.12

k-edge Connectedness

this whole graph is

1-edge connected

Albert R Meyer, March 12, 2010 lec 6F.13

Cut Edges

An edge is a **cut edge** if removing it from the graph disconnects two vertices.

Albert R Meyer, March 12, 2010 lec 6F.16

Cut Edges

B is a cut edge

Albert R Meyer, March 12, 2010 lec 6F.18

Cut Edges

deleting **B** gives two components

Albert R Meyer, March 12, 2010 lec 6F.19

Cut Edges

A is not a cut edge

Albert R Meyer, March 12, 2010 lec 6F.20

Cut Edges

still connected with edge **A** deleted

Albert R Meyer, March 12, 2010 lec 6F.21

Cut Edges

So a connected graph is **2-edge connected** iff it has **no cut edge**.

Albert R Meyer, March 12, 2010 lec 6F.22

Cycles

A **cycle** is a path that begins and ends with same vertex

path: $v \cdots b \cdots w \cdots a \cdots v$
 also: $a \cdots v \cdots b \cdots w \cdots a$

Albert R Meyer, March 12, 2010 lec 6F.23

Cycles

A **cycle** is a path that begins and ends with same vertex

also: $a \cdots w \cdots b \cdots v \cdots a$

Albert R Meyer, March 12, 2010 lec 6F.24

Simple Cycles

A **simple cycle** is a cycle of length > 2 that doesn't cross itself:

path: $v \cdots a \cdots w \cdots v$

Albert R Meyer, March 12, 2010 lec 6F.25

Simple Cycles

A **simple cycle** is a cycle of length > 2 that doesn't cross itself:

path: $v \cdots a \cdots w \cdots v$ also: $w \cdots a \cdots v \cdots w$

Albert R Meyer, March 12, 2010 lec 6F.26

Simple Cycles

length > 2 implies that going back & forth over an edge is **not** a simple cycle

Albert R Meyer, March 12, 2010 lec 6F.27

Cut Edges and Cycles

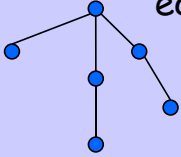

Lemma: An edge is a **not** a cut edge iff it is on a simple cycle.

Albert R Meyer, March 12, 2010 lec 6F.30

 **Trees**

A **tree** is a connected graph with **no simple cycles**.

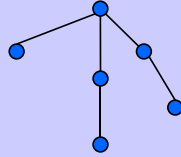

equivalently:

 Albert R Meyer, March 12, 2010 lec 6F.31

 **Trees**

A **tree** is a connected graph with **every edge a cut edge**.

 Albert R Meyer, March 12, 2010 lec 6F.32

 **More Trees**

 Albert R Meyer, March 12, 2010 lec 6F.33

 **Other Tree Definitions**

- graph with a **unique simple** path between **any 2** vertices
- connected graph with **n** vertices and **$n-1$** edges
- an **edge-maximal** acyclic graph

 Albert R Meyer, March 12, 2010 lec 6F.34

 **Team Problems**

Problems

1 & 2

 Albert R Meyer, March 12, 2010 lec 6F.40
