

QUIZ 1

1.5 HOURS

Name: \_\_\_\_\_

CLOSED BOOK QUESTIONS (20%)

For each of the following drawings, identify the components indicated by the red arrows and describe (in one sentence!) their function.

PWR

- \_\_\_\_\_ What is it ?
- \_\_\_\_\_ What is its function ?
- \_\_\_\_\_ What is it ?
- \_\_\_\_\_ What is its function ?
- \_\_\_\_\_ What is it ?
- \_\_\_\_\_ What is its function ?
- \_\_\_\_\_ What is it ?
- \_\_\_\_\_ What is its function ?
- \_\_\_\_\_ What is it ?

## QUIZ 1

1.5 HOURS

## OPEN BOOK QUESTIONS

**Short Questions (10% each)** (adapted from Shultis & Faw textbook)

- a) A nuclear reactor in a submarine delivers 18 MW of shaft power (work) at a cruising speed of 20 knots (1 knot = 1.852 km/hr). If the power plant has a thermal efficiency (= work/heat) of 25%, how much (in kg) of the  $^{235}\text{U}$  fuel is consumed on a 60,000 km trip around the world? In answering this question, make use of the following  $^{235}\text{U}$  data: 200 MeV/fission, absorption cross section = 678 b, fission cross section = 577 b
- b) Following a reactor scram, how long is it before the reactor power decreases to 0.5% of the steady-state power prior to shutdown? You may assume that the reactor had operated for an infinitely long period of time prior to shutdown.
- c) A small homogeneous sample of mass  $m$  with atomic mass  $A$  is irradiated uniformly by a constant neutron flux  $\phi$ . The microscopic scattering cross section for the sample material is denoted by  $\sigma_s$ . Derive an expression for the time it takes all nuclei in the sample to scatter once (on average) with the neutrons. State any assumptions made.

**Problem 2 (50%) – Temperature distribution within a fuel pellet with non-uniform heat generation** (adapted from Duderstadt & Hamilton textbook)

The neutron flux depression within a cylindrical pellet can be modeled by assuming that the radial dependence of  $q'''$  is of the form  $q'''(r) = q_0'''[1 + a(r/R)^2]$ , where  $q_0'''$  is the volumetric heat generation rate at the pellet centerline,  $r$  is the radial coordinate within the pellet,  $R$  is the radius of the pellet, and  $a$  is a constant.

- i) Derive an expression for the linear power in the pellet,  $q'$ , in terms of  $q_0'''$ ,  $R$  and  $a$ . (10%)
- ii) Derive an expression for the centerline temperature as a function of the constant  $a$ , the linear power  $q'$ , the fuel thermal conductivity  $k_f$ , and the fuel surface temperature  $T_{f0}$ . (25%)
- iii) Compute the centerline temperature for the following values of the constants:  $a=0.12$ ,  $q'=25$  kW/m,  $k_f=3$  W/m-K and  $T_{f0}=400^\circ\text{C}$ . (5%)
- iv) Compute the centerline temperature for the case of uniform heat generation rate and the same values of  $q'$ ,  $k_f$  and  $T_{f0}$ . Explain physically any difference you may see between the results in 'iii' and 'iv'. (10%)
