

Derivative of the Sine and Cosine

This lecture shows that  $\frac{d}{dx}(\sin x) = \cos x$  and  $\frac{d}{dx}(\cos x) = -\sin x$

We have to measure the angle  $x$  in **radians**  $2\pi$  radians = full 360 degrees

All the way around the circle ( $2\pi$  radians) **Length** =  $2\pi$  when the radius is 1

Part way around the circle ( $x$  radians) **Length** =  $x$  when the radius is 1

**Slope  $\cos x$**

at $x = 0$	slope 1 = $\cos 0$
at $x = \pi/2$	slope 0 = $\cos \pi/2$
at $x = \pi$	slope -1 = $\cos \pi$

**Slope  $-\sin x$**

at $x = 0$	slope 0 = $-\sin 0$
at $x = \pi/2$	slope -1 = $-\sin \pi/2$
at $x = \pi$	slope 0 = $-\sin \pi$

Problem:  $\frac{\Delta y}{\Delta x} = \frac{\sin(x + \Delta x) - \sin x}{\Delta x}$  is not as simple as  $\frac{(x + \Delta x)^2 - x^2}{\Delta x}$

Good idea to start at  $x = 0$  Show  $\frac{\Delta y}{\Delta x} = \frac{\sin \Delta x}{\Delta x}$  approaches 1

Draw a right triangle with angle  $\Delta x$  to see  **$\sin \Delta x \leq \Delta x$**

**straight length** =  $\sin \Delta x$   
**curved length** =  $\Delta x$

IDEA  $\frac{\sin \Delta x}{\Delta x} < 1$  and  $\frac{\sin \Delta x}{\Delta x} > \cos \Delta x$  will squeeze  $\frac{\sin \Delta x}{\Delta x} \rightarrow 1$  as  $\Delta x \rightarrow 0$

## Derivative of the Sine and Cosine

To prove  $\frac{\sin \Delta x}{\Delta x} > \cos \Delta x$  which is  $\tan \Delta x > \Delta x$  **Go to a bigger triangle**

**Triangle area** =  $\frac{1}{2}(1)(\tan \Delta x)$  greater than  
**Circular area** =  $\left(\frac{\Delta x}{2\pi}\right)$  (whole circle) =  $\frac{1}{2}(\Delta x)$

The squeeze  $\cos \Delta x < \frac{\sin \Delta x}{\Delta x} < 1$  tells us that  $\frac{\sin \Delta x}{\Delta x}$  **approaches 1**

$$\frac{(\sin \Delta x)^2}{(\Delta x)^2} < 1 \text{ means } \frac{(1 - \cos \Delta x)}{\Delta x}(1 + \cos \Delta x) < \Delta x$$

So  $\frac{1 - \cos \Delta x}{\Delta x} \rightarrow 0$  **Cosine curve has slope = 0**

For the slope at other  $x$  remember a formula from trigonometry:  
 **$\sin(x + \Delta x) = \sin x \cos \Delta x + \cos x \sin \Delta x$**

We want  $\Delta y = \sin(x + \Delta x) - \sin x$  Divide that by  $\Delta x$

$$\frac{\Delta y}{\Delta x} = (\sin x) \left( \frac{\cos \Delta x - 1}{\Delta x} \right) + (\cos x) \left( \frac{\sin \Delta x}{\Delta x} \right) \quad \text{Now let } \Delta x \rightarrow 0$$

In the limit  $\frac{dy}{dx} = (\sin x)(0) + (\cos x)(1) = \cos x = \text{Derivative of } \sin x$

For  $y = \cos x$  the formula for  $\cos(x + \Delta x)$  leads similarly to  $\frac{dy}{dx} = -\sin x$

## Practice Questions

1. What is the slope of  $y = \sin x$  at  $x = \pi$  and at  $x = 2\pi$ ?
2. What is the slope of  $y = \cos x$  at  $x = \pi/2$  and  $x = 3\pi/2$ ?
3. The slope of  $(\sin x)^2$  is  $2 \sin x \cos x$ . The slope of  $(\cos x)^2$  is  $-2 \cos x \sin x$ . Combined, the slope of  $(\sin x)^2 + (\cos x)^2$  is **zero**. Why is this true?
4. What is the **second derivative** of  $y = \sin x$  (derivative of the derivative)?
5. At what angle  $x$  does  $y = \sin x + \cos x$  have zero slope?

6. Here are amazing infinite series for  $\sin x$  and  $\cos x$ .  $e^{ix} = \cos x + i \sin x$

$$\sin x = \frac{x}{1} - \frac{x^3}{3 \cdot 2 \cdot 1} + \frac{x^5}{5 \cdot 4 \cdot 3 \cdot 2 \cdot 1} - \cdots \quad (\text{odd powers of } x)$$

$$\cos x = 1 - \frac{x^2}{2 \cdot 1} + \frac{x^4}{4 \cdot 3 \cdot 2 \cdot 1} - \cdots \quad (\text{even powers of } x)$$

7. Take the derivative of the sine series to see the cosine series.
8. Take the derivative of the cosine series to see **minus** the sine series.
9. Those series tell us that for small angles  $\sin x \approx x$  and  $\cos x \approx 1 - \frac{1}{2}x^2$ .  
With these approximations check that  $(\sin x)^2 + (\cos x)^2$  is close to 1.
